A Differential Equation is a  $n$  equation with a function and one or more of its derivatives: Example: an equation with the function  $y$  and its derivative  $dy/dx$ . Solving. We solve it when we discover the function  $y$  (or set of functions  $y$ ). There are many "tricks" to solving Differential Equations (if they can be solved!). But first: why? Why Are Differential Equations Useful?
