HLA-G histocompatibility antigen, class I, G, also known as human leukocyte antigen G (HLA-G), is a protein that in humans is encoded by the HLA-G gene.. HLA-G belongs to the HLA nonclassical class I heavy chain paralogues. This class I molecule is a heterodimer consisting of a heavy chain and a light chain (beta-2 microglobulin).The heavy chain is anchored in the membrane.

Dobroslav Kyurkchiev, in Cytokine Effector Functions in Tissues, 2017. HLA-G5. The soluble form 5 of HLA-G secreted by the MSCs is considered to be one of the factors leading to generation of Tregs. It is supposed that a pre-requisition for the HLA-G5 secretion is a direct cell-to-cell contact between the MSCs and T cells which should differentiate into Tregs. 52.59,60,63 HLA-G5 is a key ...

HLA-G belongs to the HLA class I heavy chain paralogues. This class I molecule is a heterodimer consisting of a heavy chain and a light chain (beta-2 microglobulin). The heavy chain is anchored in the membrane. HLA-G is expressed on fetal derived placental cells. The heavy chain is approximately 45 kDa and its gene contains 8 exons. Exon one encodes the leader peptide, exons 2 and 3 encode the ...

HLAG - What does HLAG stand for? The Free Dictionary

HLA-G has the unusual property of forming β 2 m-associated homodimers due to a cysteine present at position 42 of the α1 domain. HLA-G homodimers are present at the surface of normal trophoblast cells as well as 721.221 cells transfected with HLA-G, but they are not prominent on JEG-3 cells, where the monomeric form dominates (Apps et al., 2007; Gonen-Gross et al., 2003).

HLA-G - an overview | ScienceDirect Topics

Background: Human leukocyte antigen-G (HLA-G) is an important immunotolerant which could be a part of the strategies applied by malignant cells applied to avoid host immunosurveillance. Aberrant expression of HLA-G has been found in ovarian carcinoma. The aim of this study was to evaluate the HLA-G expression in ovarian cancer tissues and to explore its function in vitro.

HLA-G is one of the non-classical class I (Ib) HLA molecules. The HLA-G gene is located at the short arm of chromosome 6 in the HLA region (6p21.2-21.3) between HLA-A and HLA-F genes (figure 1A). The gene structure of HLA-G is homologous to other HLA class I (Ia) genes consisting of 7 introns and 8 exons coding the heavy chain of the molecule.

HLA-G (major histocompatibility complex, class I, G)

Then, three decades ago, an unusual human leukocyte antigen (HLA) molecule was identified: HLA-G. Uniquely expressed in EVT, HLA-G has since become the center of the present understanding of fetus-induced immune tolerance. Despite slow progress in the field, the last few years have seen an explosion in our knowledge of HLA-G biology.
