Minitab Taguchi Tutorial

Minitab provides two types of Taguchi designs that let you choose a product or process that functions more consistently in the operating environment. Both designs try to identify control factors that minimize the effect of the noise factors on the product or service.

Overview for Create Taguchi Design Learn more about Minitab 18 Use Create Taguchi Design to create a robust parameter design to identify controllable factors in your process that can minimize response variation and make your product insensitive to changes in noise factors.

Overview for Create Taguchi Design - Minitab

Minitab assigns ranks based on Delta values; rank 1 to the highest Delta value, rank 2 to the second highest, and so on. Use the level averages in the response tables to determine which level of each factor provides the best result. In Taguchi experiments, you always want to maximize the S/N ratio.

Taguchi Designs Both Taguchi designs and Factorial designs are available in the DOE menu in Minitab Statistical Software. To select a design go to Stat > DOE. Many Taguchi designs are based on Factorial designs (2-level designs and Plackett & Burman designs, as well as factorial designs with more than 2 levels).

How Taguchi Designs Differ from Factorial Designs - Minitab

Minitab offers five types of designs: screening designs, factorial designs, response surface designs, mixture designs, and Taguchi designs (also called Taguchi robust designs). The steps you follow in Minitab to create, analyze, and visualize a designed experiment are similar for all types. After you perform the experiment and enter the results ...

FRACTIONAL FACTORIAL DESIGNS Sometimes, there aren't enough resources to run a Full Factorial Design. Instead, you can run a fraction of the total # of treatments. 2k-p kdesign = k factors, each with 2 levels, but run only 2-p treatments (as opposed to 2k) 24-1 design = 4 factors, but run only 23 = 8 treatments (instead of 16) 8/16 = 1/2 design known as a "½ replicate" or "half ...
